

* Linux Process Commands

- 1) `ps`
Shows processes running in the current terminal only.
- 2) `ps -ef`
Shows all running processes of all users with:
 - PID (Process ID)
 - PPID (Parent Process ID)
 - User
 - Command.
- 3) `ps aux`
Displays all processes with CPU usage, Memory Usage, Process status.
- 4) `top`
Shows real-time running processes and system usage.
We can see: CPU usage, RAM usage, Running tasks
(Press `q` to exit)
- 5) `htop`
Advanced and colourful version of `top`.
Easy to
 - kill process
 - Sort by CPU/RAM.
- 6) `ps tree`
Shows processes in a tree structure (parent → child)
- 7) `nice`
`nice -n 10 command`
sets priority of a process (CPU scheduling)

* killing processes *

1) kill processes by name

`killall process-name.`

→ kill all running processes with the given name.

2) kill a process based on process name

`pkill process-name`

→ kills processes by matching their name or pattern.

3) Kill a single process using process (kill)

`kill PID`

→ safely terminates one specific process.

4) `kill -9`

→ forcefully kills a process (used when it's stuck)
